Kernel density estimation

Idea

Center each block on the point it represents.

Kernel density estimation

Idea

Center each block on the point it represents.

Implementation:

Define individual block

$$K(u) = \frac{1}{2} \mathbb{I}[|u| \leq 1]$$

It has the properties

$$K(u) \geq 0, \quad \int_{-\infty}^{+\infty} K(u) du = 1$$

Kernel density estimation

Idea

Center each block on the point it represents.

Implementation:

Define individual block

$$K(u) = \frac{1}{2} \mathbb{I}[|u| \leq 1]$$

It has the properties

$$K(u) \geq 0, \quad \int_{-\infty}^{+\infty} K(u) du = 1$$

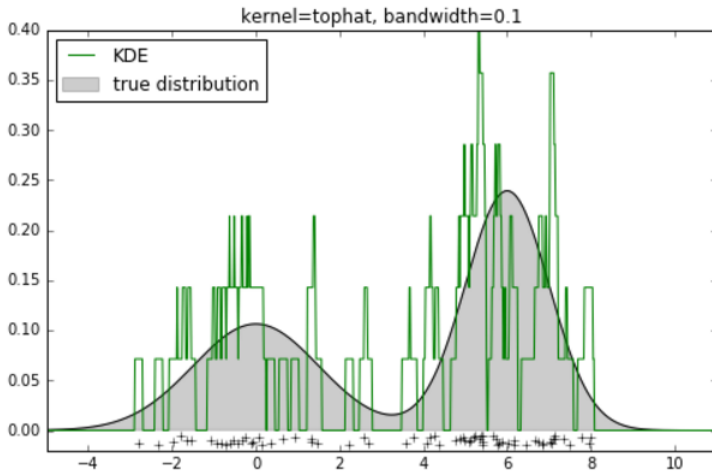

Kernel density estimation (KDE)

$$\hat{p}(x) = \frac{1}{Nh} \sum_{i=1}^N K\left(\frac{x - x_i}{h}\right)$$

Comments

- $K(u)$ is called *kernel*
- $K(u) = \frac{1}{2}\mathbb{I}[|u| \leq 1]$ is called *tophat kernel*
- h is called *bandwidth*
- h controls the smoothness of KDE - how?

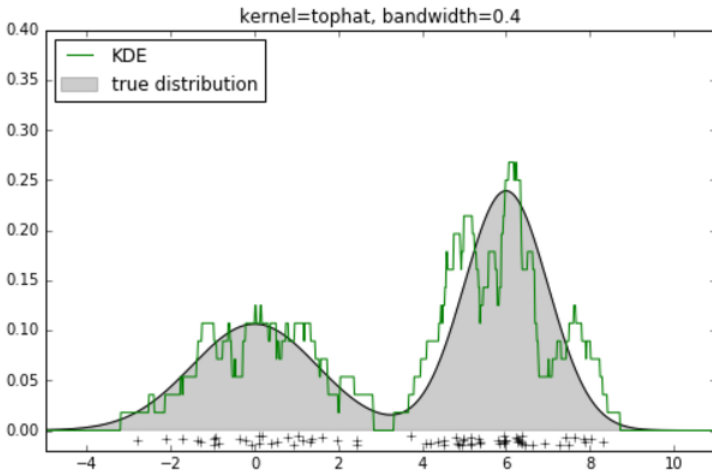

Example: tophat KDE

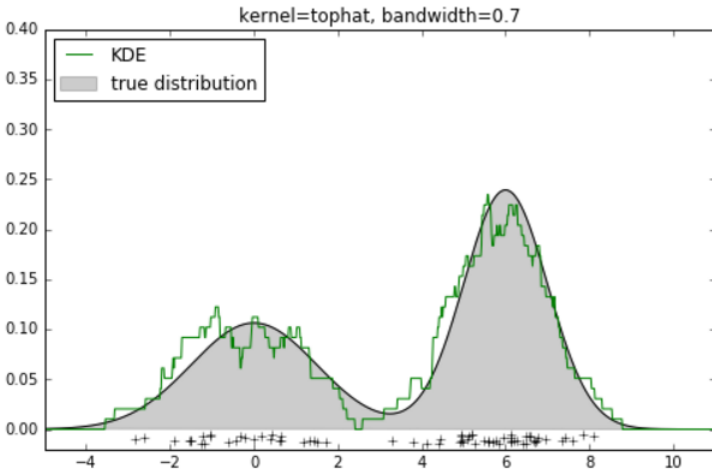

Example: tophat KDE

Example: tophat KDE

Example: tophat KDE

Example: tophat KDE

Extension of tophat kernel

Problems of tophat:

- Resulting KDE $\hat{\rho}(x) = \frac{1}{Nh} \sum_{i=1}^N K\left(\frac{x-x_i}{h}\right)$ is **discontinous**.
- Impact of close points x_i does not change with $\rho(x, x_i)$

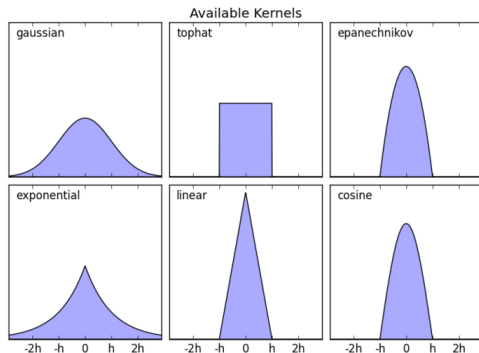

²example by Jake Vanderplas

Extension of tophat kernel

Problems of tophat:

- Resulting KDE $\hat{\rho}(x) = \frac{1}{Nh} \sum_{i=1}^N K\left(\frac{x-x_i}{h}\right)$ is **discontinous**.
- Impact of close points x_i does not change with $\rho(x, x_i)$

We can use smooth unimodal kernels²:

Example: Gaussian KDE

Example: Gaussian KDE

Example: Gaussian KDE

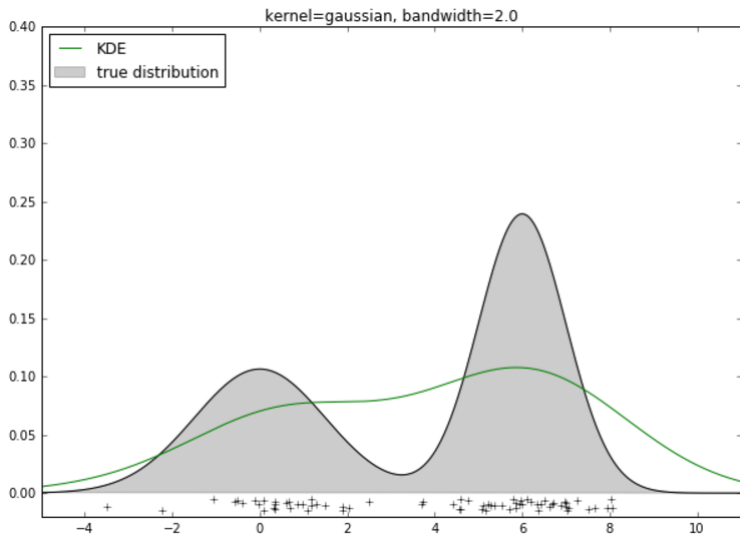

Example: Gaussian KDE

Mathematical definitions of kernels

name	definition of $K(u)$
tophat (rectangular)	$\frac{1}{2}\mathbb{I}[u \leq 1]$
Gaussian	$\frac{1}{\sqrt{2\pi}}e^{-\frac{u^2}{2}}$
biweight	$\propto [(1 - u^2)^2]_+$
triangular	$[1 - u]_+$
Epanechnikov	$\propto [1 - u^2]_+$

Mathematical definitions of kernels

name	definition of $K(u)$
tophat (rectangular)	$\frac{1}{2}\mathbb{I}[u \leq 1]$
Gaussian	$\frac{1}{\sqrt{2\pi}}e^{-\frac{u^2}{2}}$
biweight	$\propto [(1 - u^2)^2]_+$
triangular	$[1 - u]_+$
Epanechnikov	$\propto [1 - u^2]_+$

Comments:

- type of kernel affect smoothness but not accuracy of approximation.
- selection of bandwidth is more important for accuracy

Technical conditions for consistency

Kernel consistency

Kernel density estimation $\hat{p}(x)$ is consistent if

$$\mathbb{E}[(\hat{p}(x) - p(x))^2] \xrightarrow{N \rightarrow \infty} 0 \text{ for } \forall x$$

Technical conditions for consistency

Kernel consistency

Kernel density estimation $\hat{\rho}(x)$ is consistent if

$$\mathbb{E}[(\hat{\rho}(x) - \rho(x))^2] \xrightarrow{N \rightarrow \infty} 0 \text{ for } \forall x$$

Sufficient conditions for consistency:

- Bandwidth convergence:
- $\lim_{N \rightarrow \infty} h(N) = 0$
 - $\lim_{N \rightarrow \infty} Nh(N) = \infty$

Technical conditions for consistency

Kernel consistency

Kernel density estimation $\hat{p}(x)$ is consistent if

$$\mathbb{E}[(\hat{p}(x) - p(x))^2] \xrightarrow{N \rightarrow \infty} 0 \text{ for } \forall x$$

Sufficient conditions for consistency:

- Bandwidth convergence:
 - $\lim_{N \rightarrow \infty} h(N) = 0$
 - $\lim_{N \rightarrow \infty} Nh(N) = \infty$
- Kernel regularity:
 - $\int |K(u)| du < \infty$
 - $\int K(u) du = 1$
 - $\sup_u K(u) < \infty$
 - $\lim_{u \rightarrow \infty} |uK(u)| = 0$

Multivariate extension

Multivariate kernels:

$$\hat{p}(\mathbf{x}) = \frac{1}{Nh^D} \sum_{i=1}^N K\left(\frac{1}{h}(\mathbf{x} - \mathbf{x}_i)\right)$$

name	definition of $K(\mathbf{u})$
Gaussian	$\frac{1}{(2\pi)^{D/2}} e^{-\frac{\mathbf{u}^T \mathbf{u}}{2}}$
Epanechnikov	$\propto [1 - \mathbf{u}^T \mathbf{u}]_+$
Product of univariate kernels	$\prod_{d=1}^D K_d\left(\frac{x^d - x_n^d}{h}\right)$

Multivariate extension

Distance based kernels:

$$\hat{p}(\mathbf{x}) = \frac{1}{Nh^D} \sum_{i=1}^N K(\rho(\mathbf{x}, \mathbf{x}_i))$$

name	definition of $K(\rho(x, x_i))$
Gaussian	$\frac{1}{(2\pi)^{D/2}} e^{-\frac{\rho^2(x, x_i)}{2}}$
Epanechnikov	$\propto [1 - \rho^2(x, x_i)]_+$

Selection of h

Bandwidth selection guideline

The more dense is sample points distribution, the smaller should be h .

Selection of h

Bandwidth selection guideline

The more dense is sample points distribution, the smaller should be h .

Constant bandwidth:

- $h = \frac{1}{N} \sum_{i=1}^N d_{iK}$, d_{iK} -distance from x_i to its K -th nearest neighbour
- out-of-sample maximum likelihood

Variable bandwidth (for significantly variable densities):

- $h(x)$ - distance to $K - th$ nearest neighbour from x

Parzen window method

Estimate $\rho(x|y)$ with KDE:

$$\rho(x|y) = \frac{1}{N_y h^D} \sum_{i:y_i=y} K\left(\frac{\rho(x, x_i)}{h}\right)$$

Bayes decision rule gives:

$$\begin{aligned} \hat{y} &= \arg \max_y \rho(y|x) \propto \rho(y)\rho(x|y) \\ &= \arg \max_y \frac{N_y}{N} \frac{1}{N_y h^D} \sum_{i:y_i=y} K\left(\frac{\rho(x, x_i)}{h}\right) \\ \hat{y} &= \arg \max_y \sum_{i:y_i=y} K\left(\frac{\rho(x, x_i)}{h}\right) \end{aligned}$$

K-nearest neighbours method

$$p(x' \in V(x)) = \int_{V(x)} p(x) dx \xrightarrow{|V| \rightarrow 0} p(x) |V| \quad (1)$$

$$p(x' \in V(x)) \xrightarrow{N \rightarrow \infty} \frac{m}{N} \quad (2)$$

From equations (1) and (2) we obtain, that for $N \rightarrow \infty$, $|V(N)| \rightarrow 0$, $V(N)N \rightarrow \infty$:

$$p(x) \rightarrow \frac{m}{N|V|}$$

KNN density estimation:

- 1 fix m
- 2 find $V(x)$ such that it covers m points

KDE density estimation:

- 1 fix $V(x)$
- 2 find number of points m inside

K-nearest neighbours classification

Apply for class-conditional probability:

$$p(x|y) \approx \frac{\sum_{k=1}^K \mathbb{I}[y_{i(k)} = y]}{N_y |V|}$$

Bayes decision rule gives:

$$\begin{aligned} \hat{y} &= \arg \max_y p(y|x) \propto p(y)p(x|y) \\ &= \arg \max_y \frac{N_y}{N} \frac{\sum_{k=1}^K \mathbb{I}[y_{i(k)} = y]}{N_y |V|} = \arg \max_y \sum_{k=1}^K \mathbb{I}[y_{i(k)} = y] \end{aligned}$$
